

ProKNX – gRTC Software

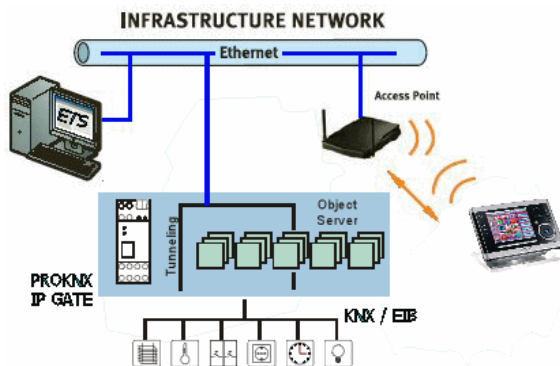

Bidirectional Pronto - KNX/EIB Interface Software for KNX Room controller

This Pronto configuration file is for the TSU9600 / 9800. The software ProKNX is a very powerful Pronto Script software for 2 way communication with the KNX Bus system.

- It is possible to communicate with up to 14 Room Temperature Controller (RTC). For every RTC it is possible to
 - Switch between different operating modes (building protection, night, standby, comfort mode)
 - Adjust Basic Set point
 - Visualize actual Temperature and Set point
 - Visualize up to 3 additional messages
- With the second activity of this software you may also
 - define two different weekly timers to switch between Night and Comfort mode for each room
 - save the hourly values of set point and actual temperature and show them as a curve
- The language of the GUI may be selected in English, French or German. Any other language may be added.
- The system configuration insures no parameter lost in case of power down of the Pronto.
- The software will run with multiple Pronto. That means, once done a configuration, it will run simultaneously on another Pronto in the same network. Just make sure to use one of our multiple access ProKNX gateways.
- A help function will solve questions and insures operation.

- The Pronto “gestures” feature is supported.
- The software is compatible with RTCs where operation mode switching is done with one byte. It has been tested with KNX room controllers of the following manufacturers.
 - ALBRECHT JUNG
 - BERKER
 - SCHNEIDER / MERTEN
 - HAGER
 - ELSNER
- Operation Mode Switching by bit is also possible. However in this case only Comfort, Night and Building Protection Mode are supported.
- Please contact us if you are not sure of the compatibility of the chosen RTC.
- The ProKNX gateway may also be used to configure the bus with ETS software (LAN, WLAN and WAN is possible!). No need for another programming interface.
