

ProKNX – iPhone KNX control

Bidirectional iPhone, iPod touch and iPad - KNX/EIB Interface Software for KNX communication

ProKNX for iPhone is a native visualization software for iPod touch, iPhone and iPad. The IP gateway ProKNX-IPi (or ProKNX-IP+) allows direct EIB/KNX bus access through your WLAN router. *ProKNX for iPhone* permits the following KNX functionality:

- On / Off switching
- Dimming control
- KNX Scene switching
- shutter, sunblind and curtain control
- Room Controller mode control

A very important advantage of this application is that configuration is done through a simple text file. Just define the communication objects in a list, upload it on our server, and your apple device will be configured. A sample file may be downloaded from our web - server in the download section.

No license limits to use this software on more than one apple device. One configuration file is sufficient and may be used for every device in your household. It may be stored on any storage medium, and even if your iPhone will be replaced, the original configuration is safe and ready to use.

If you are using a Philips Pronto with the ProKNX modular software and the ProKNX-IP+ gateway, the *ProKNX for iPhone* configuration file may even be generated automatically out of the Pronto configuration file. In this case you have just to upload your Pronto “xcf” to our server. You will get a 4 digit code which will give access to your apple device to download the *ProKNX for iPhone* configuration file “icf”. There is no easier way to configure your system!

On the KNX side the ProKNX-IP gateways provides communication objects that may be assigned with the ETS Software to the existing group addresses. These assignments will be used by Pronto and iPhone in the same way. That means, once you have setup a KNX system with the Pronto, the iPhone application will work "out of the box".

The ProKNX-IP gateways may also be used to configure the bus with ETS software (LAN, WLAN and WAN is possible!). No need for another programming interface.

For your iPhone, KNX - access is possible through GSM (3G) by configuring your router with a VPN tunnel.

The *ProKNX for iPhone* application will be available free of charge in May/June 2010 in the apple store.
